Shoe size is determined by a wide range of factors, including: age, weight, foot conditions, genetics. There is no official data on the average size of shoes for men in the United States, but unofficial data show that it is about a size 10.5 with an average width. The size of the shoe does not indicate general health. It also does not indicate the size of the penis, which is a common misconception. Any shoe size for men is considered normal. Shoe size is relatively proportional to growth in men, especially after puberty. Tall men tend to have larger legs than average tall or shorter men. Of course, variables can affect this, including age, activity level and weight. Estimated shoe sizes by height for men in the United States: Legs and shoe sizes often get larger as men age. This is due to a number of factors, including weight gain and leg wear take over time. The ligaments and tendons in the leg tend to weaken with age, flattening the arch and making the legs bigger. Leg conditions, such as hammer legs and bunions, can also lead to men demanding larger shoe sizes. Shoe sizes come in length and width. The number refers to the length of the leg. The letter, or group of letters, refers to the width of the leg. Many men's shoes are only available in medium width. Sometimes they are indicated D after the number. Specialty shoe widths range from narrow (B) to wide, very wide, extra extra wide, and so on. In the United States, the average height for men who are at least 20 years old is about 5 feet 9 inches, with an average shoe size of about 10.5 and an average width (D). The most common shoe size for men worldwide is usually between 9 and 12. The United States is home to people of different ethnic and genetic backgrounds. Countries that are more homogeneous tend to have a population of more similar heights and shoe sizes, which affects their national averages. Nutrition, especially before puberty, can also have an effect on the height and size of the shoe. In countries where people are malnourished or malnourished, parameters such as the height and size of shoes may be lower than in other countries. Unless you're Michael Phelps, the size of your feet doesn't have much of an impact on any aspect of your life or health. Phelps, an Olympic champion and swimmer, famously has a size 14 feet, which is said to help him advance in the water. The size of men's feet is not an indicator of health. Tall men tend to have bigger legs than short or medium-sized men do. In the United States, the average shoe size in men is thought to be about 10.5. The curse of big feet makes shoe purchases quite predictable. You scan the racks in the middle store and, time after time, you turn empty-handed (ER, legs). Just because you wear a size 11 or higher doesn't mean you have to be stuck Lifelong sleazy shoes or unflattering shoes are better created for the scene at Lucky Cheng (no judgment here - but we can't wear our lucite platforms all the time). Don't stress; While Still pretty thin in brick-and-mortar stores, we found plenty of shoe options in every style (and price range) on interwebs, so your feet will be just as well dressed as the rest of you. We know, we know. You're an adult; You know what size shoes you should wear; You've been buying shoes for years. Well, bad news. According to a study by Podiatry College in the UK, most people wear shoes that are the wrong size for their feet. In fact, when a group surveyed more than 2,000 adults in 2014, they found that one-third of men and nearly half of women were pushing their feet in shoes that just didn't fit the right. Obviously, wearing the wrong size shoes is a problem in terms of pain, but in the long run, it can also cause big problems like bunions, foot strain (such as hammer or nail damage), and pain even if you're barefoot. Sure, you could go to the store and get your feet measured regularly, but if you have other things you'd enjoy doing with your life like, anything, that's how to measure your own. Start by installing a sheet of paper on the floor (preferably no carpet, so no depreciation causes any give). Then place either a bare foot or sock foot (depending on whether you wear socks with most of your shoes) on paper and trace around it. If you have a outline, take a ruler and make a rectangle around the outside of your contour as close to it as possible. Then measure the width and length between these parallel lines and subtract three sixteenths of an inch from each measurement (go ahead and break out the calculator, we don't judge). Measuring the length will dictate the size of the shoe, while the width will determine, well, the width (although most people fall within the range of the average width.) above your head, who wears what to see all the measuring breakdowns and find out if you wore the wrong size all together. Imagine: You

wander around a shoe store when you come across the perfect pair of shoes. But there is only one problem. It's men's shoes, and you're a woman, or vice versa. Men's and women's shoe sizes are slightly different; Size 8 in men's shoes is not the same size as 8 in women's shoes. Knowing your companion size can give you many more options, especially if your legs are wide for a woman or narrow for a man. Generally speaking, women with wide legs may find a better fit in a pair of men's shoes because men's shoes are made in a wider width, while men with narrow legs also find shoes that come in narrower widths in feminine sizes. And there are more shoes in the smaller range in women's sizes and more choices in larger sizes in men's shoes, so if your shoe size falls to these extremes for your gender, you may also find more choice if you also consider shoes for the opposite sex. So if you are looking for unisex style like a pair of sneakers, oxfords, loafers, or substantial sandals, you you Find a pair that fits best if you've thrown a wide net and look around at the styles on the market for the opposite sex. Transforming men's shoes into women's sizes is quite simple. If you are a woman, generally speaking, you should deduct two sizes from your shoe size of US women. If you're a man, add two sizes from your US men's shoe size. For example, let's say you're the size of a U.S. woman 8.5. Your American male companion size is 6.5. With sneakers, subtract size and half if you are a woman and add one and a half size if you are a man. If you carry a US women's size of 8.5, you would probably find a comfortable fit in a sneaker of seven US men. These conversion recommendations may come in handy, but they are still very generalized rules of the thumb. Conversions vary quite a bit from brand to brand and even between different shoe styles made by the same company. So use these conversions as a starting point. How the shoe fits so far is what determines the right size. Trying a pair of shoes in a store is the best way to find the perfect one for any type of shoe. If you shop online you don't have that luxury, so the best thing you can do is measure your feet and then compare that to the size of the chart presented on the website. But it's not just the length, as men's shoes tend to be wider than women's and women's than men's. If you are a woman whose male shoe size is 6.5, for example, you may find that you need to go down an extra half or full size to get the right fit if the shoes are too wide. It is also advisable to order two different sized shoes, so you can compare fit, but before you order anything, make sure you thoroughly research the seller's return policy. The size of 39 shoes on the European scale is equivalent to a male 6 or 6.5 in U.S. sizes. Size 39 is also equivalent to a female size 8, 8.5 or 9. The various measurement increases used in these two systems prevent a direct conversion of European size into the size of the United States. Shoe sizes in Europe and the United States come from a cobbler's tool known as the latter, which resembles a human leg. Differences between sizes arise with different scale measurements used by English and continental European cobblers. Sizes in the U.S. have changed from the English system. Sex in the city Clothing Dimensions are getting harder and harder to determine. In some stores you might be a size 10, the other 14, with bras you vary between 3AC-34D and when it comes to shoes, you can be anything from 4 to 6.It's frustrating and unfortunately it seems that we are heading towards even more confusion and scattered sizes, throwing our perceived true dimensions out of the window in favor of everything that fits the mentality. The Mirror investigated how Street is measured-up when it comes to the standard shoe size in particular. One reporter from the website visited six different stores, discovering that not only did she vary between size 4 and 6 from store to store, but she often frequented Size in different size of shoes in the same store, too. Bonkers.And the reason seems to be pretty simple. Years ago, there were size shapes for British manufacturers to base their product samples on, but according to the Mirror, brands are increasingly moving their shoe production to Asia and throwing the size of the book out the window. Matthew Fitzpatrick, an orthopaedic consultant from Podiatry College, told the Mirror: In the past there were fewer retailers selling shoes were most built around traditional shape sizes. But as demand for cheap fashion has increased, each company is reducing its own individual shapes, explaining why there is such a variation on the high street.
