Use container storage fields: photos, movies, sounds of documents, including Microsoft Word and Excel files, PDF files, etc. You can refer to container fields in computational formulas or consolidated fields. Data in container fields is built in by default. Instead, you can: Keep a link in the field when selecting a file to insert into it (see Use of data in container fields) determine the storage field outside (see below) you can make the container field interactive to optimize the field for content such as audio, video, or PDF files. See the indication formats for container fields. If you save the FileMaker Pro Advanced file as a self-contained copy, container data stored as a reference to the file, as well as data stored outside, are embedded in container fields in copies. See save and copy files. GetContainerAttribute can be used to track how the contents of the container field are stored and how much storage space it uses. This feature also returns metadata about container field content, such as height and width of images, photo orientation, audio cover, barcode type, and signature tags. Keep container data outside: it's easy to share data. Storing data outside makes it easy to share a multiplayer database as each user works with data stored in one central location. You don't need to set up the total on each local computer to use container fields in a multiplayer environment. You can insert files into container fields from your hard drive without having to copy them to the total amount first. For example, the shared product database includes a container field for photos of products. When a user inserts a file into a container box in one place, the file is transferred and stored in the directory on the host computer. When users elsewhere view the database records, a photo of the product appears in their copy of the container field. Storage of container data outwardly contributes to faster backup, because after pre-backup, subsequent backups only copy external files that have been added or modified. Container data stored outside of a secure storage facility is encrypted by default and can be read by FileMaker Pro Advanced with secure storage. In addition, you can save data in your home format (through open storage), giving you more control over how folders and files are organized in the external file system. See the setting up of container storage fields outside. Important regular backups are highly recommended for any document stored on your computer. Can't find or sort the records on container field, but you can identify box to describe or identify the contents of the container. You can then find or sort records based on information in the text field. Any option would use less storage space than storing the same graphic with each entry. You can create a script that includes a step of the Insert File script to indicate the contents of the container field. To change the location, see external container data storage. Links to files are not supported by FileMaker WebDirect, FileMaker Data, or Custom Web Publishing. Using data in container fields Container Field can store photos, multimedia files or any other type of file that you want to keep in the database. How data is inserted determines how you see and interact with data in a container field. See the table below for FileMaker Pro. To insert This picture Choose Insert zgt; Picture, then select a picture to insert. FileMaker Pro displays the image in the field. Audio or video file For an interactive container, choose to insert the menu of the audio/video and then choose the file to paste. Then you can play audio or video file in the box. Watch audio and video work in interactive containers. File PDF For the interactive container, select the Insert menu and then select the PDF file for insertion. See how you work with PDF files in interactive containers. Any file Choose Insert menu, then select a file to insert (such as a spreadsheet file, word processing file, or any other type of file you want to track). FileMaker Pro displays the file icon and name in the container box, but not the actual content. Note To insert packaged files, such as Keynote Files, into a container box, archive, or zip up packaged files. A container box with a picture Container inserted field with file FileMaker Pro inserted supports the following image and audio/video formats. Media Caption picture Encapsulated Postscript (.eps) GIF (.gif) JPEG/JFIF (.jpg) JPEG 2000 (.jp2) (OS X) MacPaint (.mac) (OS X) PDF (.pdf) (OS X) PhotoShop (.psd) (OS X) PNG (.png) SGI (.sgi) (OS X) Targa (.tga) (OS X) TIFF (.tif) Windows bitmap (.bmp) Windows Metafile/Enhanced Metafile (.wmf/.emf) Audio File (.aif/.aiff) AVI Movie (.avi) MP3 Audio File (.mp3) MPEG-4 Audio File (.m4a) MPEG-4 Movie (.mp4) MPEG Movie (.mpeg/.mpe) MPEG-4 video file (.m4v) Fast time movie (.mov/.qt) (see notes below) Sun Audio File (.au) WAVE Audio File (.wav) Windows Media Audio (.wma) Windows Media Video (.wmv) (see notes below) Notes, some formats such as Fast Time VR are not supported. OS X: For Windows Media Videos (.wmv) format. You need to install Flip4Mac. You can also automatically open or email an exported file. Can't find or sort records based on information in the text field, or use a global container field. Any option would use less storage space than storing the same graphic with each entry. You can create a script that includes a step of the Insert File script to indicate the contents of the container field. When data about containers stored outside is stored on the FileMaker Server, the data may be at a different volume than databases, including on a remote volume. Can't manage external container data storage and FileMaker Server information. The link file in the container fields is only supported in server scripts if the file is in a folder that FileMaker Server has access to (see Paths in scripts on the server side). Links to files are not supported in FileMaker WebDirect or custom Web Publishing. Publishing, filemaker view pdf in container field
